Multisite Guide

SessionQuota Pro · https://handyplugins.co/docs/sessionquota-multisite-guide/

SessionQuota Pro supports multisite environments in a network-managed way.

Core rule

On multisite, SessionQuota Pro should be network-activated and managed from Network Admin.

Why network-managed mode matters

A network-wide setup helps keep session rules consistent across the multisite installation.

This is especially useful when you want:

- Shared login policy across sites
- Centralized administration
- Consistent session enforcement

Where to manage settings

In multisite, use:

- Network Admin -> `Settings -> SessionQuota Pro`

Do not expect separate site-level configuration for each subsite.

What changes in multisite

- Settings are managed at network level
- Plugin behavior is designed around network activation
- WP-CLI includes network-specific commands
- Monitoring can include network-aware data

Recommended setup

1. Network-activate SessionQuota Pro
2. Set the global session limit
3. Choose your enforcement mode
4. Review role-based and membership-based rules
5. Test login behavior across more than one site if your users move between sites

Good use cases

- Membership networks
- Education platforms
- Franchise or portal multisites
- Multi-brand networks with shared users

Things to test

- Login behavior across multiple sites
- Frontend session widgets on network sites
- WP-CLI network commands
- Monitoring visibility and retention behavior
