Multisite Guide

Stream Integration Pro · https://handyplugins.co/docs/stream-integration-pro-multisite-guide/

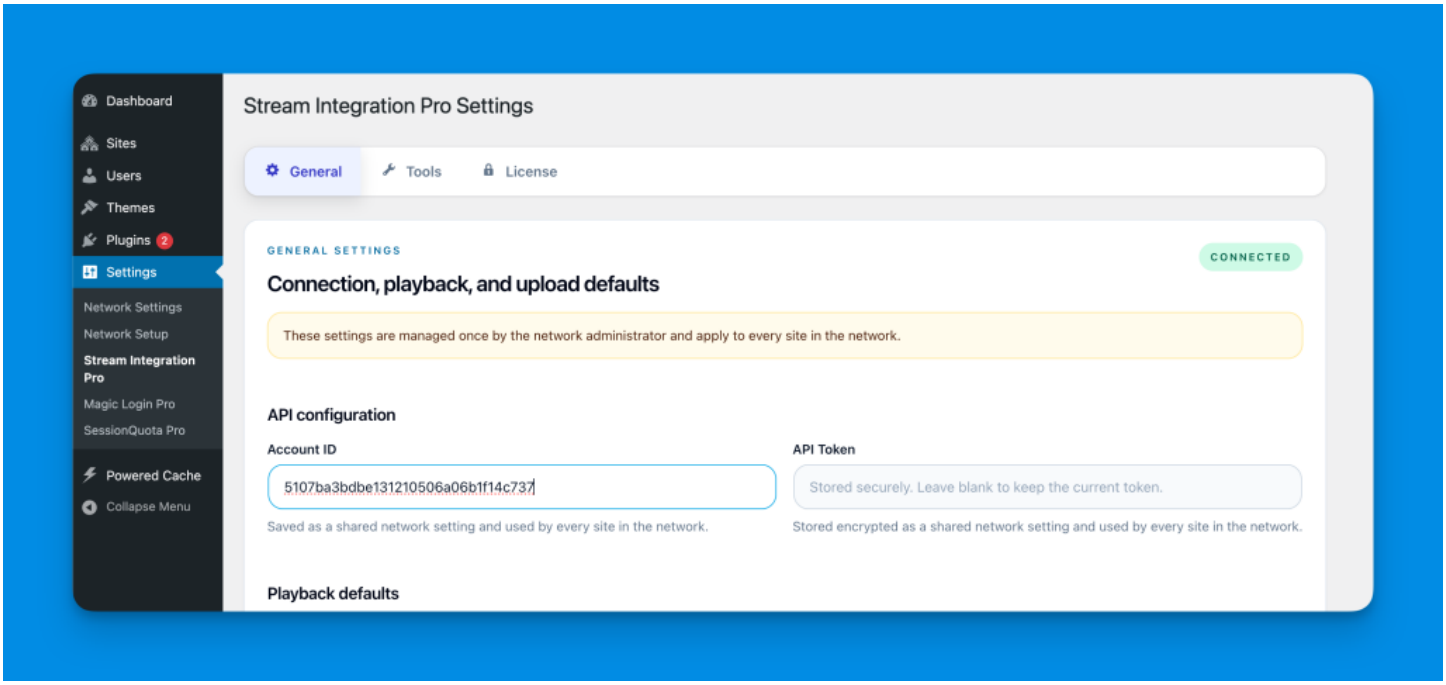

This guide explains how Stream Integration Pro behaves in WordPress multisite.

Supported Multisite Modes

The plugin supports:

- site-level activation on a single subsite
- network activation across the whole multisite network

Network-Activated Mode

When Stream Integration Pro is network-activated:

- shared plugin settings are managed in `Network Admin > Settings > Stream Integration Pro`
- Cloudflare credentials are managed once for the network
- the license is managed once for the network

- update checks use the network activation context

At the same time:

- each subsite keeps its own Media Library
- each subsite keeps its own attachments
- site users still use Stream workflows inside their own site

What Site Users Can Still Do

Even in network-activated mode, site-level users can still:

- upload videos to the Media Library
- auto-import local videos to Stream
- use Stream videos in blocks and shortcodes
- import videos from the Stream library
- restore local copies
- manage their own site’s attachment-level actions

The network admin owns the global account configuration, but day-to-day media work stays site-specific.

What Moves to the Network Admin

These become network-managed when Stream Integration Pro is network-activated:

- plugin settings
- Cloudflare credentials
- license data
- updater configuration

Storage Scope Rules

Shared across the network

- credentials
- playback defaults
- storage defaults
- licensing and update metadata

Still site-specific

- Media Library attachments
- attachment status and metadata
- local file existence
- queue jobs for that site’s attachments
- cleanup actions for that site’s library

Recommended Multisite Model

The best mental model is:

- the network admin owns the Stream account connection
- each subsite uses Stream as part of its own Media Library workflow

This is closest to how shared remote storage usually behaves in multisite.

Important Note About Permissions

The plugin is designed so that:

- network admins manage shared configuration
- site-level users manage site-level media workflows

If you want to further restrict Stream library access in a multisite network, plan that policy before rollout and test it with your real editorial roles.
