Tools and Cleanup

Stream Integration Pro · https://handyplugins.co/docs/stream-integration-pro-tools-and-cleanup/

The `Tools` tab is where you manage background jobs, retained diagnostics, and destructive cleanup workflows.

Embedded media: https://handyplugins.co/wp-content/uploads/2026/04/CleanShot-2026-04-13-at-21.00.22.mp4

Operations and Queue

This section helps you understand background work such as:

- auto-import jobs
- Stream metadata sync jobs
- local restore jobs
- local cleanup jobs

Enable detailed queue diagnostics

When enabled:

- recent completed and failed queue history is retained
- recent history becomes visible in the UI
- failed jobs can be reviewed and retried more easily

When disabled:

- finished queue history is not retained
- the UI stays quieter
- only active work is relevant

Queue history retention

These settings only matter when detailed diagnostics are enabled.

You can control:

- completed history retention in days
- failed history retention in days

Clear queue history

This removes retained completed and failed history for Stream Integration Pro’s queue.

It does not:

- stop active jobs
- cancel running jobs
- delete WordPress media items

Media Cleanup Danger Zone

This section is intentionally destructive.

Use it when you want to clean up storage in a controlled way.

Available cleanup actions

- `Delete local files`
- `Delete Cloudflare Stream copies`

Available target states

Depending on the action, you can target states such as:

- `Local + Stream`
- `Stream only`
- `Missing local file`

Built-in safety checks

Before the cleanup runs, Stream Integration Pro shows:

- how many attachments match

- sample items
- a warning that explains what will happen
- a confirmation checkbox

The cleanup button stays disabled until you explicitly confirm the action.

Recommended Cleanup Rules

When to delete local files

Use this when:

- you trust Stream as the long-term storage location
- the videos are already confirmed ready in Cloudflare Stream
- you want to reduce local disk usage

When to delete Stream copies

Use this when:

- you want to keep WordPress as the only storage location
- you are cleaning up imported or migrated Stream copies
- you understand some `Stream only` items may become removable if no local file exists

Uninstall Cleanup Setting

The `Tools` tab also contains the uninstall cleanup preference.

If enabled, uninstall removes plugin data such as:

- plugin settings
- encrypted credentials
- saved license data
- retained queue history
- scheduled Stream Integration Pro jobs
- Stream Integration Pro attachment meta

It does not remove:

- WordPress media items
- local upload files
- Cloudflare Stream videos
